InstockQ: Can I use a variable in the constructor of an object? In Java, we can use a variable in the constructor, like so:

ClassName variable = new ClassName(); But what about when the variable is a method? Is it possible to do something like: MethodName method = new MethodName(); I know that I can just assign a method to the variable, but this is not my question.

A: No, it's not possible. A variable can be instantiated as a constructor is: MyClass variable = new MyClass(); However, a method can only be invoked: MyClass.myMethod(); A: The reason that you can assign a method to a variable is that a method is itself a variable. For instance, you can change the behavior of any method by storing that method (or code that computes that method) in a field. Thus if you store a method that changes your object (modifies an instance variable, creates a new instance of it, etc.), then your object will be affected. This is called a method reference, and can be created with the following notation: Foo

```
foo = null; foo = FOO::bar; // Since foo is null,
```

A: The file has been posted here. However I don't see why you should be concerned about the authenticity of this file. If you were concerned about authenticity I would have deleted the linked file right away and posted the contents of the ZIP file instead. You should be concerned about this file since it is already infected with viruses. Since you have antivirus software on your system you should be able to detect it and delete it. Furthermore the file links to a website that looks like fake rar, zip and 7z files. It might be dangerous. So my advice is, don't download this file. Q: Setting environment variables in Powershell Is there a way in PowerShell to set environment variables in Windows without the command line? Ie. c:\Users\username>ipconfig /reg regedit Thanks A: You can also just put them on the beginning of the PS \$profile.ps1 file. I'm assuming that you're not using any kind of package manager as they do this under the hood and probably make changes to the \$profile.ps1 file without telling you. A: This is done as part of the standard Windows Setup process. You should definitely read through the "Problem Resolution" section in the actual Setup installation process.
